"Complete nucleotide sequence and deduced polypeptide
nonmuscle myosin heavy chain gene from Acanthamoeba:
hinge in the rodlike tail.";
J. Cell Biol. 105:913-925(1987).
J. FUNCTION: MYOSIN IS A PROTEIN THAT BINDS TO F-ACT
ACTIVITY THAT IS ACTIVATED BY F-ACTIN.
-I- SUBUNIT: MYOSIN II HEAVY CHAIN IS TWO-HEADED. IT
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Interpro; IPR001800; Lipoprotein_6.

THIS REGION IS INTERRUPTED BY A HINGE AND JOINED BY A NONHELICAL TAILPIECE WHERE THE REGULATORY PHOSPHORYLATION SITES RESIDE.
MISCELLANGEDUS: THE HINGE REGION MAY PLAY A KEY ROLE IN MEDIATING THE EFFECT OF HEAVY CHAIN PHOSPHORYLATION ON ENZYMATIC ACTIVITY. SIMILARITY: CONTAINS 1 MYOSIN-LIKE GLOBULAR HEAD DOMAIN.

SIMILARITY: CONTAINS 2 1Q DOMAINS.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                (MLC-2).

FUNCTION: MUSCLE CONTRACTION.

FUNCTION: MYOSIN IS A PROTEIN THAT BINDS TO F-ACTIN & HAS ACTIVITY THAT IS ACTIVATED BY F-ACTIN.

SUBUNIT: MUSCLE MYOSIN IS A HEXAMERIC PROTEIN THAT CONSIST HEAVY CHAIN SUBUNITS (MHC), 2 ALKALI LIGHT CHAIN SUBUNITS (AMC-2).

SAND 2 REGULATORY LIGHT CHAIN SUBUNITS (MC-2).

SUBCELLULAR LOCATION: THICK FILAMENTS OF THE MYOFIBRILS.

SIMILARITY: CONTAINS 1 MYOSIN-LIKE GLOBULAR HEAD DOMAIN.

SIMILARITY: CONTAINS 1 IQ DOMAIN.

FUNCTION: MUSCLE CONTRACTION.

SUBUNIT: MUSCLE MYOSIN IS A HEXAMERIC PROTEIN THAT CONSISTS OF 2

HEAVY CHAIN SUBUNITS (MHC), 2 ALKALI LIGHT CHAIN SUBUNITS (MLC)

AND 2 REGULATORY LIGHT CHAIN SUBUNITS (MLC-2).

SUBCELLULAR LOCATION: THICK FILAMENTS OF THE MYOFIBRILS.

DOMAIN: THE RODLIKE TAIL SEQUENCE IS HIGHLY REPETITIVE, SHOWING

CYCLES OF A 28-RESIDUE REPEAT PATTERN COMPOSED OF 4 HEPTAPEPTIDES,
                                                                                                                   33:575-583(1983)
